

FSQ100

Green Mode Fairchild Power Switch (FPS™)

Features

- Internal Avalanche-Rugged SenseFET
- Precision Fixed Operating Frequency (67KHz)
- Burst-Mode Operation
- Internal Start-up Circuit
- Pulse-by-Pulse Current Limiting
- Over-Voltage Protection (OVP)
- Overload Protection (OLP)
- Internal Thermal Shutdown Function (TSD)
- Auto-Restart Mode
- Under-Voltage Lockout (UVLO) with Hysteresis
- Built-in Soft Start
- Secondary-Side Regulation

Applications

- Charger & Adapter for Mobile Phone, PDA, MP3
- Auxiliary Power for White Goods, PC, C-TV, Monitor

Description

The FSQ100 consists of an integrated Pulse Width Modulator (PWM) and SenseFET, specifically designed for high-performance, off-line, Switch-Mode Power Supplies (SMPS) with minimal external components. This device is an integrated high-voltage power switching regulator that combines a VDMOS SenseFET with a voltage mode PWM control block. The integrated PWM controller features include a fixed oscillator, Under-Voltage Lockout (UVLO) protection, Leading Edge Blanking (LEB), an optimized gate turn-on/turn-off driver, Thermal Shutdown (TSD) protection, and temperature-compensated precision-current sources for loop compensation and fault protection circuitry.

When compared to a discrete MOSFET and controller or RCC solution, the FSQ100 device reduces total component count and design size and weight, while increasing efficiency, productivity, and system reliability. This device provides a basic platform well suited for cost-effective flyback converters.

Ordering Information

Product Number	Package	Marking Code	BV _{DSS}	f _{osc}	R _{DS(on)}
FSQ100	8-DIP	Q100	650V	67KHz	16Ω

FPS™ is a trademark of Fairchild Semiconductor Corporation.

Typical Application

Figure 1. Typical Flyback Application

OUTPUT POWER TABLE		
Product	Open Frame ⁽¹⁾	
	230VAC ±15% ⁽²⁾	85~265VAC
FSQ100	13W	8W

Notes:

1. Maximum practical continuous power in an open-frame design with sufficient drain pattern as a heat sinker, at 50°C ambient.
2. 230VAC or 100/115VAC with doubler.

Internal Block Diagram

Figure 2. Functional Block Diagram

Pin Assignments

Figure 3. Pin Configuration (Top View)

Pin Definitions

Pin #	Name	Description
1	GND	Ground. SenseFET source terminal on primary side and internal control ground.
2	Vcc	Positive Supply Voltage Input. Although connected to an auxiliary transformer winding, current is supplied from pin 5 (Vstr) via an internal switch during start-up (see Figure 2). When V _{CC} reaches the UVLO upper threshold (9V), the internal start-up switch opens and device power is supplied via the auxiliary transformer winding.
3	Vfb	Feedback. Inverting input to the PWM comparator with its normal input level lies between 0.5V and 2.5V. It has a 0.4mA current source connected internally, while a capacitor and opto-coupler are typically connected externally. A feedback voltage of 4.5V triggers overload protection (OLP). There is a time delay while charging external capacitor C _{fb} from 3V to 4.5V using an internal 5μA current source. This time delay prevents false triggering under transient conditions, but still allows the protection mechanism to operate in true overload conditions.
4	NC	No Connection.
5	Vstr	Start-up. This pin connects directly to the rectified AC line voltage source. At start-up, the internal switch supplies internal bias and charges an external storage capacitor placed between the VCC pin and ground. Once the V _{CC} reaches 9V, the internal switch stops charging the capacitor.
6,7,8	Drain	SenseFET Drain. The drain pins are designed to connect directly to the primary lead of the transformer and are capable of switching a maximum of 650V. Minimizing the length of the trace connecting these pins to the transformer decreases leakage inductance.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. $T_A = 25^\circ\text{C}$, unless otherwise specified.

Symbol	Parameter	Value	Unit
V_{DRAIN}	Drain Pin Voltage	650	V
V_{STR}	Vstr Pin Voltage	650	V
V_{DG}	Drain-Gate Voltage	650	V
V_{GS}	Gate-Source Voltage	± 20	V
V_{CC}	Supply Voltage	20	V
V_{FB}	Feedback Voltage Range	-0.3 to V_{STOP}	V
P_{D}	Total Power Dissipation	1.40	W
T_{J}	Operating Junction Temperature	Internally limited	$^\circ\text{C}$
T_{A}	Operating Ambient Temperature	-25 to +85	$^\circ\text{C}$
T_{STG}	Storage Temperature	-55 to +150	$^\circ\text{C}$

Notes:

1. Repetitive rating: Pulse width is limited by maximum junction temperature.
2. $L = 24\text{mH}$, starting $T_{\text{J}} = 25^\circ\text{C}$.

Thermal Impedance

$T_A = 25^\circ\text{C}$, unless otherwise specified. All items are tested with the JEDEC standards JESD 51-2 and 51-10 (DIP).

Symbol	Parameter	Value	Unit
θ_{JA}	Junction-to-Ambient Thermal Impedance ⁽³⁾	88.84	$^\circ\text{C}/\text{W}$
θ_{JC}	Junction-to-Case Thermal Impedance ⁽⁴⁾	13.94	$^\circ\text{C}/\text{W}$

Notes:

3. Free-standing with no heatsink; without copper clad. Measurement condition – just before junction temperature T_{J} enters into OTP.
4. Measured on the DRAIN pin close to plastic interface.

Electrical Characteristics

T_A = 25°C, unless otherwise specified.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
SenseFET Section

Functional Description

1. Start-up: At start-up, the internal high-voltage current source supplies the internal bias and charges the external V_{CC} capacitor, as shown in Figure 14. When V_{CC} reaches 9V, the device starts switching and the internal high-voltage current source stops charging the capacitor. The device is in normal operation provided V_{CC} does not drop below 7V. After start-up, the bias is supplied from the auxiliary transformer winding.

Figure 14. Internal Start-up Circuit

Calculating the V_{CC} capacitor is an important step to design with the FSQ100. At initial start-up, the maximum value of start operating current I_{START} is about $100\mu A$, which supplies current to UVLO and V_{REF} blocks. The charging current I_{VCC} of the V_{CC} capacitor is equal to $I_{STR} - 100\mu A$. After V_{CC} reaches the UVLO start voltage, only the bias winding supplies V_{CC} current to the device. When the bias winding voltage is not sufficient, the V_{CC} level decreases to the UVLO stop voltage and the internal current source is activated again to charge the V_{CC} capacitor. To prevent this V_{CC} fluctuation (charging/discharging), the V_{CC} capacitor should be chosen to have a value between $10\mu F$ and $47\mu F$.

Figure 15. Charging V_{CC} Capacitor through V_{str}

2. Feedback Control: The FSQ100 is a voltage mode controlled device, as shown in Figure 16. Usually, an opto-coupler and shunt regulator, like KA431 are used to implement the feedback network. The feedback voltage is compared with an internally generated sawtooth waveform. This directly controls the duty cycle.

When the shunt regulator reference pin voltage exceeds the internal reference voltage of 2.5V, the opto-coupler LED current increases, the feedback voltage V_{FB} is pulled down, and it reduces the duty cycle. This happens when the input voltage increases or the output load decreases.

Figure 16. PWM and Feedback Circuit

3. Leading Edge Blanking (LEB): At the instant the internal SenseFET is turned on, the primary-side capacitance and secondary-side rectifier diode reverse recovery typically causes a high-current spike through the SenseFET. Excessive voltage across the R_{SENSE} resistor lead to incorrect pulse-by-pulse current limit protection. To avoid this, a leading edge blanking (LEB) circuit disables pulse-by-pulse current-limit protection block for a fixed time (t_{LEB}) after the SenseFET turns on.

4. Protection Circuit: The FSQ100 has protective functions, such as overload protection (OLP), over voltage protection (OVP), under-voltage lockout (UVLO), and thermal shutdown (TSD). Because these protection circuits are fully integrated inside the IC without external components, reliability is improved without increasing costs. Once a fault condition occurs, switching is terminated and the SenseFET remains off. This causes V_{CC} to fall. When V_{CC} reaches the UVLO stop voltage V_{STOP} (7V), the protection is reset and the internal high-voltage current source charges the V_{CC} capacitor via the V_{str} pin. When V_{CC} reaches the UVLO start voltage V_{START} (9V), the device resumes normal operation. In this manner, the auto-restart can alternately enable and disable the switching of the power SenseFET until the fault condition is eliminated.

Figure 17. Protection Block

Application Tips

1. Methods of Reducing Audible Noise

Switching mode power converters have electronic and magnetic components that generate audible noise when the operating frequency is in the range of 20~20,000Hz. Even though they operate above 20kHz, they can make noise, depending on the load condition. Designers can employ several methods to reduce noise.

Glue or Varnish

The most common method involves using glue or varnish to tighten magnetic components. The motion of core, bobbin and coil, and the chattering or magnetostriction of core can cause the transformer to produce audible noise. The use of rigid glue and varnish helps reduce the transformer noise, but can crack the core. This is because sudden changes in the ambient temperature cause the core and the glue to expand or shrink in a different ratio.

Ceramic Capacitor

Using a film capacitor instead of a ceramic capacitor as a snubber capacitor is another noise-reduction solution. Some dielectric materials show a piezoelectric effect, depending on the electric field intensity. Hence, a snubber capacitor becomes one of the most significant sources of audible noise. It is possible to use a Zener clamp circuit instead of an RCD snubber for higher efficiency as and lower audible noise.

Adjusting Sound Frequency

Moving the fundamental frequency of noise out of 2~4kHz range is the third method. Generally, humans are more sensitive to noise in the range of 2~4kHz. When the fundamental frequency of noise is located in this range, the noise is perceived as louder, although the noise intensity level is identical (refer to Figure 22 Equal Loudness Curves).

When FPS acts in burst mode and the burst operation is suspected to be a source of noise, this method may be helpful. If the frequency of burst-mode operation lies in the range of 2~4 kHz, adjusting the feedback loop can shift the burst operation frequency. To reduce the burst operation frequency, increase a feedback gain capacitor (C_F), opto-coupler supply resistor (R_D), and feedback capacitor (C_B); and decrease a feedback gain resistor (R_F), as shown in Figure 23.
